

# **BELGIAN PARLIAMENT TO CONSIDER OFFICIAL RECOGNITION OF ELECTROSENSITIVITY**

On July 20, 2011, three Green Party members of the Belgian Parliament introduced the following resolution recognizing electro-hypersensitivity:

## **PROPOSED RESOLUTION**

**THE HOUSE OF REPRESENTATIVES,**

- A. Considering the growing exposure of the population to various electromagnetic fields;
- B. Considering that there exist a growing number of citizens who suffer from complex effects on their physical and mental health, linked to exposure to electromagnetic radiation;
- C. Considering that those complex effects can cause a very significant deterioration of the social context within which these persons are able to move;
- D. Considering that few studies really take account of the link between the exposure and the evoked symptoms, nor of the potential damage to exposed but non-affected citizens;
- E. Considering that professional training in this matter is almost non-existent, probably because of the present very weak state of scientific knowledge in this area;
- F. Considering that there are numerous prospective studies in progress with diverse preliminary results that tend towards real messages of precaution with regard to exposure to this type of radiation;
- G. Considering that developments in other countries have permitted a substantial amelioration in the lives of, and social integration of, citizens affected by these symptoms;
- H. Considering that it is essential to respond in an adequate fashion to the suffering which these people report, in their everyday lives, within their families and in their work, in order to preserve a strong social link that permits them to surmount so stigmatizing a handicap;
- I. Considering that the WHO has declared, following an intensive review of the scientific literature, that “however, our knowledge of the biological effects of these fields still contains gaps and research must be pursued in order to fill them”;
- J. Considering that there is no broad consensus among scientists to assure a total absence of long-term harm from this radiation;

## CALLS ON THE FEDERAL GOVERNMENT,

1. to officially recognize the existence of the syndrome “electro-hypersensitivity” as an illness and to recognize as a handicap the maladjustments and functional impairments that result, in consultation with the academies of medicine and the Council of Health;
2. to conduct and take part in studies aimed at bringing to light the exact mechanisms and establishing the causal link between exposure and symptoms;
3. to make health professionals aware of the existence of this syndrome and to strengthen their education relative to environmental illnesses both in their core curriculum and in the continuing education classes that they are required to take;
4. to strongly apply the precautionary principle in the face of the significant amount of uncertainty concerning the link between exposure to electromagnetic radiation and the health effects that may be attributable to it;
5. to require, in public places, zones that are free from WiFi, WiMax and DECT [cordless telephone systems], where the use of portable telephones would be prohibited, in order to protect electro-hypersensitive persons and give them access to public, social, and health services;
6. to inform the managers of public establishments, including health establishments (hospitals), but also community facilities such as day-care centers, rest homes and nursing homes, about the needs of persons suffering from electro-hypersensitivity.

20 July 2011

Thérèse SNOY, Green Party delegate  
Muriel GERKENS, Green Party delegate  
Eva BREMS, Green Party delegate
